FACTS ABOUT THE PRESSURE COOKER

Pressure cooking is a way of cooking food in liquid using a gasket-sealed pan to retain steam and build pressure. By increasing the pressure inside the pan, the boiling point of the liquid in the pressure cooker is raised to 120°C to 125°C, significantly higher than the normal boiling point of 100°C. The increased temperature of the water and steam causes the fibres of the food to break down more quickly, and shortens the cooking time by up to 70 per cent. This pressure cooker is designed for use on gas, electric, ceramic and induction stovetops. During cooking, you adjust the burner on your stove to maintain the required pressure as registered by the valve, or regulator, on the lid of the pressure cooker. If the pressure cooker is overheated, or the valve becomes blocked, excess steam will be released automatically through a vent, or through a safety valve if both the valve and vent become blocked. When the pressure cooker is removed from the heat and starts to cool, the steam condenses, the pressure inside the pan is lost and the lid can then be safely opened.

USING YOUR PRESSURE COOKER

There are two pressure levels on the pressure cooker:
• High Pressure: Suitable for cooking a range of foods.
• Low Pressure: Suitable for delicate foods such as chicken breasts, fish and spinach.
• Once the lid has been locked, turn the heat level to HIGH to more quickly attain the pressure level you require.
• Once the pressure has been reached, reduce the heat to keep the pressure stabilised. You can see when your pressure level has been reached by the valve on the lid of your cooker.
• To reduce the heat enough to maintain pressure, you may need to use a smaller burner on a gas stove, or for electric stoves it’s a good idea to set another burner on low and move the pressure cooker to the lower burner once your pressure level has been reached.
• It is important that you never let the flames from the gas burner lick up around the sides of the pan as this can cause discoloration of the cooker walls. Even when cooking on a high heat, keep the flame low enough so that it doesn’t creep up the sides of the cooker.
• Using a timer, time the cooking from the moment the pressure you require has been reached.

• Depending on the amount of food or liquid being used, the cooker can take between 30 seconds and 15 minutes to reach full pressure.

PRESSURE RELEASE

There are two ways to release pressure:

• Natural-Release Method: The cooker is taken off the heat source and left to cool down gradually until the pressure releases on its own (this is preferable as it is gentler on the food and saves energy, reduces vapour, odour and water usage).

• Valve-Release Method: Remove pressure cooker from the heat source. Turn Regulator Valve to setting to ▼ and wait until the indicator pin goes down. When the indicator valve is down, there is no pressure left inside the pressure cooker and it can now be opened.

Once the pressure has been released, you can remove the lid of your pressure cooker. To remove the lid, turn it to unlock and then flip the lid to a vertical position facing away from you to protect yourself from the escaping hot steam.

CLEANING YOUR PRESSURE COOKER

• You must clean your pressure cooker thoroughly after each use.
• Remove the gasket from the lid and wash the lid and base with hot soapy water.
• This stainless steel pressure cooker is also dishwasher friendly.
• Avoid putting the lid of the pressure cooker into a dishwasher as this will damage the valve.
SAFETY COMES FIRST

Following these basic guidelines will ensure major problems are avoided:

1. Do not fill the pressure cooker to its capacity. The maximum fill line is either half-way or two-thirds of the way up the side wall on the inside of the cooker.
2. Do not leave the house or make a telephone call away from the pressure cooker when it is on the stove top. The heat level needs to be carefully regulated, so ensure the cooker is not left unattended for too long. If the heat level gets too high, steam will be released from the safety valves and all the liquid inside the cooker will evaporate, possibly causing damage to the cooker.
3. Lifting steamer inserts, bowls or dishes from a hot pressure cooker can be dangerous. Always place a folded towel or piece of muslin under the cooking vessel so that you can lift things in and out of the cooker carefully. To do this, place the covered basin or dish on a folded tea towel. Pick up the ends of the cloth and carefully lift the cooking dish and lower it into the base of the cooker. Fold the ends of the towel over the dish, close and lock the lid. Once the cooking time finishes, release the pressure and open the lid. Using tongs, lift the ends of the cloth and let them fall over the sides of the cooker to cool for a few seconds. Pick up the cloth ends and carefully use them to lift the vessel from the cooker.
4. Food that tends to foam or froth should not be cooked in the pressure cooker. This includes pasta, porridge and cranberries.
